Too coolth for School

Jaga's new DBE Pro radiator, launching at Ecobuild is designed specifically for use with reverse cycle heat pumps, making a single unit capable of either heating or cooling for the first time.

The maker says that, combined with their low mass, low water heat exchangers, these new radiators can cut CO₂ emissions by a tonne a year and reduce annual heating bills by 15-25%. Not only that, but connected to a heat pump, it also becomes passive cooling during the summer months.
